DEFINITIONS

Table 1. Key Terms and Definitions

Key Terms	Definitions
Algorithm	An algorithm is a set of commands that must be followed for a computer to perform calculations or other problem-solving operations. It is a systematic procedure that in a finite number of steps produces an answer to a question or the solution of a problem.
Application ⁱ	A programme, or group of programmes, hosted on enterprise assets and designed for end-user. Applications are considered a software asset in this document. Examples include web, database, cloud-based and mobile applications.
Ciphertext	is a result of encryption performed on plain text using a cipher. A cipher is a mathematical function that scrambles data so that it cannot be read by anyone who does not have the key to decrypt it. Cipher text is also known as encrypted or encoded information
Cloud environment	A virtualised environment that provides convenient, on-demand network access to a shared pool of configurable resources such as network, computing, storage, applications and services. There are five essential characteristics to a cloud environment: on-demand self-service, broad network access, resource pooling, rapid elasticity, and measured service. Some services offered through cloud environments include Software as a Service (SaaS), Platform as a Service (PaaS), and Infrastructure as a Service (IaaS).
Cryptography ⁱⁱ	Cryptography is the practice of developing and using coded algorithms to protect and obscure transmitted information so that it may only be read by those with the permission and ability to decrypt it.
Cryptographic Keys ⁱⁱⁱ	A cryptographic key is a piece of information that is used in combination with an algorithm to transform plaintext into ciphertext (encrypted text) or vice versa.
Data Authenticity	The property that data originated from its purported source ¹
Decryption	Decryption is the process of converting previously encrypted data into information that can be read by humans and/or computers.

Key Terms	Definitions
Encryption ^{iv}	Encryption is the process of transforming readable plaintext into unreadable ciphertext to mask sensitive information from unauthorised users. The process of converting data into a code (ciphertext) to prevent unauthorised access.
End-user devices	Information technology (IT) assets used among members of an enterprise during work, off-hours, or any other purpose. End-user devices include mobile and portable devices such as laptops, smartphones and tablets, as well as desktops and workstations. For the purpose of this document, end-user devices are a subset of enterprise assets.
Mobile end-user devices	Small, enterprise issued end-user devices with intrinsic wireless capability, such as smartphones and tablets. Mobile end-user devices are a subset of portable end-user devices, including laptops, which may require external hardware for connectivity. For the purpose of this document, mobile end-user devices are a subset of end-user devices.
Network Infrastructure	Refers to all the resources of a network that make network or internet connectivity management, business operations and communication possible. It consists of hardware and software, systems and devices, and it enables computing and communication between users, services, applications, and processes. Network Infrastructure can be cloud, physical or virtual.
Non-Repudiation ^v	Assurance that the sender of information is provided with proof of delivery and the recipient is provided with proof of the sender's identity, so neither can later deny having processed the information.
Physical environment	Physical hardware parts that make up a network, including cables and routers. The hardware is required for communication and interaction between devices on a network.
Plaintext ^{vi}	Intelligible data that has meaning and can be understood without the application of decryption. It is ordinary readable text.
Portable end-user devices	Transportable, end-user devices that have the capability to wirelessly connect to a network. For the purpose of this document, portable end-user devices can include laptops and mobile devices such as smartphones and tablets, all of which are a subset of enterprise assets.
Remote devices	Any enterprise asset capable of connecting to a network remotely, usually from public internet. This can include enterprise assets such as end-user devices, network devices, non-computing/Internet of Things (IoT) devices, and servers.
Removable media	Any type of storage device that can be removed from a computer while the system is running and allows data to be moved from one system to another. Examples of removable media include compact discs (CDs), digital versatile discs (DVDs) and Blu-ray discs, tape backups, as well as diskettes and universal serial bus (USB) drives.

Key Terms	Definitions
Servers	A device or system that provides resources, data, services, or programs to other devices on either a local area network or wide area network. Servers can provide resources and use them from another system at the same time. Examples include web servers, application servers, mail servers, and file servers.
Technical and organisational measures	.
User accounts ^{vii}	An identity created for a person in a computer or computing system. It is an established relationship between a user and computer, network or information service. For personal computers there are typically two types of user accounts: standard and administrator. User accounts with escalated privileges are covered under administrator accounts.
Virtual environment	Simulates hardware to allow a software environment to run without the need to use a lot of actual hardware. Virtualised environments are used to make a small number of resources act as many with plenty of processing, memory, storage, and network capacity. Virtualisation is a fundamental technology that allows cloud computing to work.

	TITLE: The Use of Encryption Policy and Procedure (UEPPro)	REVISION NO.: 00	REVISION DATE: March 20, 2025

1.0 TITLE: The Use of Encryption Policy and Procedure

2.0 POLICY STATEMENT

In compliance with the seventh standard of the Data Protection Act, 2020 (DPA) The Council of Legal Education - Norman Manley Law School ("NMLS") is required to take appropriate technical and organisational measures against unauthorised or unlawful processing of personal data and against accidental loss or destruction of or damage to personal data. The NMLS is committed to identifying and implementing appropriate cybersecurity measures to ensure compliance. For the purposes of the DPA, technical and organisational measures include the encryption of personal data.

3.0 PURPOSE

The purpose of this policy is to ensure that the NMLS employs measures to mitigate against accidental loss, destruction or damage of the personal data processed in its operations. The policy defines rules for the management of its internal technological systems and applications which include using encryption controls, and cryptographic keys, in order to protect the confidentiality, integrity, authenticity and non-repudiation of information. Encryption controls refer to measures implemented to secure data by converting it into an unreadable format through encryption algorithms. These controls ensure that only authorised individuals or systems can access and decrypt the data, protecting it from unauthorised disclosure or manipulation.

4.0 SCOPE

The policy applies to all network infrastructure, communication and storage devices used by the NMLS to manage information. This includes systems used to manage human resources, student information and Legal Aid Clinic (LAC) client and library user files. Whether held internally or managed by NMLS data processors, it extends to data on end-user devices containing sensitive data, data in transit, data at rest, data on removable media and cloud services.

Handwritten signature and date:
20/3/2025

NORMAN MANLEY LAW SCHOOL

	DEPARTMENT/UNIT: Office of the Principal	DOCUMENT NO: OOP/ /UEPPro/ 00	PAGE 2 OF 29
	TITLE: The Use of Encryption Policy and Procedure (UEPPro)	REVISION NO.: 00	REVISION DATE: March 20, 2025

5.0 PROCEDURE

5.1 Use of Encryption

NMLS must ensure that the technical and organisational measures implemented provide a level of security appropriate to any harm that might result from such unauthorised or unlawful processing or accidental loss, destruction, or damage to the nature of the personal data to be protected.

Technical and organisational measures include :

- pseudonymisation and encryption of persona data,
- the ability to ensure the ongoing confidentiality, integrity, availability and resilience of processing systems and services,
- the ability to restore the availability of and access to personal data promptly in the event of a physical or technical incident;
- a process for regularly testing, assessing and evaluating the effectiveness of technical and organisational measures for ensuring the security of the processing and;
- measures to ensure the adherence to the technical and organisational^{viii2} requirements specified in the of the provisions of the Data Protection Act.

Based on the foregoing, NMLS must protect individual systems and information using the following encryption controls.

5.1.1 Encryption Controls

The Information Technology personnel are responsible for preparing detailed instructions on the use of the mentioned encryption tools. Owners of individual assets to which encryption controls are applied are responsible for appropriate application of individual encryption controls.

² Section 30(6) of the Data Protection Act

JS 20/3/2025

NORMAN MANLEY LAW SCHOOL

	DEPARTMENT/UNIT: Office of the Principal	DOCUMENT NO: OOP/ /UEPPro/ 00	PAGE 3 OF 29
	TITLE: The Use of Encryption Policy and Procedure (UEPPro)	REVISION NO.: 00	REVISION DATE: March 20, 2025

5.1.2 End-User Devices

Encryption Method: Full disk encryption or file-based encryption.

Description: All personal data on end-user devices such as laptops, desktops, and mobile devices will be encrypted. This ensures that if a device is lost or stolen, the data remains inaccessible to unauthorised users.

Tools: BitLocker, File Vault, or other device-specific encryption tools.

Access Control: Strong passwords or two factor authentication to decrypt and access the data on the device.

5.1.3 Data in Transit

All data transmitted over external networks, including the internet, must be encrypted using secure protocols (e.g., Transport Layer Security (TLS), Secure Shell (SSH)).

Encryption Method: TLS or Internet Protocol Security (IPsec).

Description: Data transmitted between systems, networks, or over the internet will be encrypted to protect it from interception and unauthorised access during transmission. This includes communications like emails, file transfers, and application programme interface (API) interactions.

Protocols: HTTPS for web traffic, VPNs for secure connections, and secure email protocols like S/MIME or PGP.

Certificate Management: Digital certificates will be used to authenticate endpoints and establish secure, encrypted connections.

5.1.4 Data at Rest

All personal data, including Personally Identifiable Information (PII), financial records, and academic records, must be encrypted using strong encryption algorithms (e.g., AES-256).

MS 20/3/2025

NORMAN MANLEY LAW SCHOOL

	DEPARTMENT/UNIT: Office of the Principal	DOCUMENT NO: OOP/ /UEPPro/ 00	PAGE 4 OF 29
	TITLE: The Use of Encryption Policy and Procedure (UEPPro)	REVISION NO.: 00	REVISION DATE: March 20, 2025

Encryption Method: Database encryption, file-level encryption, or whole disk encryption.

Description: All personal data stored on servers, databases, and storage devices will be encrypted to prevent unauthorised access. Encryption at rest protects data even if physical access to storage media is compromised.

Tools: Transparent Data Encryption (TDE) for databases, volume encryption tools like Linux Unified Key Setup (LUKS), or cloud provider-specific encryption services.

Key Management: Cryptographic keys used for encryption will be managed securely, with strict access controls and regular key rotation.

5.1.5 Removable Media

Encryption Method: Hardware-based encryption or software-based encryption.

Description: Data stored on removable media, such as USB drives, external hard drives, and SD cards, will be encrypted. This ensures that if the media is lost or stolen, the data remains protected.

Tools: Tools like BitLocker To Go, VeraCrypt, or hardware-encrypted USB drives.

Access Control: Encrypted media will require authentication (password, PIN, or biometric) to access the stored data.

5.1.6 Cloud Services

Encryption Method: Server-side encryption (SSE) or client-side encryption (CSE).

Description: Data stored in cloud services will be encrypted both at rest and in transit. Cloud providers will offer built-in encryption services, while client-side encryption can be employed for additional security, ensuring that data is encrypted before it leaves the user's device.

Providers: Utilise encryption services provided by cloud providers like Amazon Web Services (AWS), Azure, or Google Cloud Platform (GCP).

20/3/2025

NORMAN MANLEY LAW SCHOOL

	DEPARTMENT/UNIT: Office of the Principal	DOCUMENT NO: OOP/ /UEPPro/ 00	PAGE 5 OF 29
	TITLE: The Use of Encryption Policy and Procedure (UEPPro)	REVISION NO.: 00	REVISION DATE: March 20, 2025

Key Management: Leverage the cloud provider's key management services (KMS) or bring-your-own-key (BYOK) options for enhanced control over encryption keys.

5.1.7 Cryptographic keys

The Information Technology personnel are responsible for prescribing the following rules regarding key management:

- Generating random private and public cryptographic keys
- activation and distribution of cryptographic keys
- defining the time limit for the use of keys and their regular updating (in accordance with risk assessment)
- archiving inactive keys which are necessary for encrypted electronic archives
- destruction of keys

Cryptographic Keys are managed by their owners in line with the above-mentioned rules.

Cryptographic keys will be stored in secure, encrypted environments such as Hardware Security Modules (HSMs) or dedicated key management systems (KMS) with strong access controls to prevent unauthorised access. The keys will be backed up regularly in a secure location and transmitted in an encrypted method to ensure protection at all times. Only authorised personnel with proper clearance will have access to the keys. Access will be governed by multi-factor authentication and role-based access controls to minimise the risk of unauthorised changes or access.

In the event of key loss, corruption, or destruction, the following recovery process will be employed:

Backup Retrieval: The most recent encrypted backup of the key will be retrieved from the secure storage location.

Handwritten signature and date: 20/3/2025

NORMAN MANLEY LAW SCHOOL

	DEPARTMENT/UNIT: Office of the Principal	DOCUMENT NO: OOP/ /UEPPro/ 00	PAGE 6 OF 29
	TITLE: The Use of Encryption Policy and Procedure (UEPPro)	REVISION NO.: 00	REVISION DATE: March 20, 2025

Restoration Process: The key will be restored using a secure and verified restoration process. The integrity of the recovered key will be checked to ensure it has not been tampered with or corrupted during the recovery process.

Incident Response: A formal incident response procedure will be followed to investigate the cause of the key loss, corruption, or destruction, and appropriate measures will be taken to prevent future occurrences.

Notification: Relevant stakeholders will be notified about the recovery process and any potential impact on operations.

5.1.8 Managing access encryption keys

Any Head of Department or Supervisor must consult with the Information Technology personnel with respect to granting access to other employees.

Detailed procedures are to be developed by the Information Technologist in consultation with the IT Consultant.

6.0 RESPONSIBILITIES

6.1 Compliance/ Monitoring/ Review

Validity and document management

The Information Technologist shall under the direction of the principal review this policy and, update the document as necessary every six months.

- Each Head of Department is responsible for the administrative and technical measures for all new software and equipment acquired for the use of the relevant department;
- Each Head of Department must ensure that new equipment or software introduced is the subject of a Data Protection Impact Assessment prior to the use or acquisition of such equipment or software;

UNCONTROLLED WHEN PRINTED.

	TITLE: The Use of Encryption Policy and Procedure (UEPPro)	REVISION NO.: 00	REVISION DATE: March 20, 2025

- c) IT Personnel shall conduct DPIAs on all new software and technologies prior to approval.
- d) Policies and procedures for the registration and use of new software and equipment and reporting of issues with relation to the same are to be developed by the Information Technology personnel;
- e) Penetration testing and cryptographic validation testing is to be administered every two years by an entity or individual with the requisite capacity.
- f) The IT personnel shall employ measures to address findings from the penetration and cryptographic validation testing and report on these developments every six (6) months, or earlier as needed, following receipt of the results of the test.
- g) A shared registration system should be implemented by the Information Technologist to facilitate the logging and management of software and equipment being utilised by the NMLS
- h) A training plan should be implemented to ensure that supervisors and Heads of Department will participate in training on conducting data protection impact assessments;
- i) Where staff are permitted to work remotely, the Information Technologist shall discuss with the relevant staff member encryption measures and safeguards to be put in place.
- j) The NMLS will provide resources necessary for the development of competence in encryption by the main users of the policy.
- k) This policy will be reviewed annually or as needed to accommodate changes in technology, legal requirements, or organisational needs.

IT Department: Responsible for implementing and maintaining encryption technologies and key management.

Head of Department: Responsible for managing staff members to adhere to this policy.

Staff: Must ensure that they adhere to this policy.

Handwritten signature and date:
20/3/2025

UNCONTROLLED WHEN PRINTED.

	TITLE: The Use of Encryption Policy and Procedure (UEPPro)	REVISION NO.: 00	REVISION DATE: March 20, 2025

Students: Must follow guidelines for protecting personal data, especially when transmitting or storing it on personal devices.

6.1.1 Reporting

The Information Technologist shall report to the principal on the effectiveness of the encryption measures and employed to protect the assets of the school and makes recommendations as to the corrective and preventative actions on an annual basis.

6.1.2 Records Management

The Information Technologist is responsible for maintaining a repository of DPIAs on all new software and IT equipment being introduced to or utilised by each department of the NMLS.
